# General terms and conditions

## 1. Order placement:

An order is only deemed to have been placed if it has been confirmed by us in writing. Additions, changes or verbal agreements require our written confirmation to be effective. The documents contained in our printed matter, such as dimensions and weights, illustrations and descriptions, are only approximately authoritative, without there being any obligation to notify us of changes that have been made. In illustrations, drawings, sketches and other documents we reserve ownership and copyright; they may not be made accessible to others without our permission and must be returned immediately upon request. The customer assumes full liability for the documents to be supplied by him, such as drawings, gauges, samples or the like. Verbal information about dimensions and the like require written confirmation. For documents that the customer makes available, he bears full responsibility with regard to commercial legal protection. Samples are only delivered with retention of title. Call orders are to be fulfilled within a maximum of 12 months or an agreed term.

## 2. Prices:

The prices are ex works and do not include packaging, freight, postage and value insurance. The same applies to partial deliveries and express shipments. Packaging and shipping are done to the best of our judgement, but without any obligation.

## 3. Terms of payment:

Payments are to be made in EURO without any deductions free to our payment office in accordance with the agreed terms of payment. Orders with a net value of less than €150 will be subject to a €50 processing fee. In the event of late payment, interest will be charged at the rate charged by our bank for credit claims, subject to the right to claim further damages. The withholding of payments or offsetting due to any counterclaims by the customer are excluded. We reserve ownership of the delivered goods until the purchase price has been paid in full, including interest and the costs of any legal action, including against third parties. We are entitled to assert the retention of title, except to charge an additional flat-rate fee of 10% of the sales price for the proven expenses. Deliveries to companies unknown to us are only made if the amount is sent in advance. In the event of suspension of payment or bankruptcy of the customer, the purchase price claim is due immediately.

## 4. Delivery time:

The delivery time is calculated from the day of the order confirmation until dispatch from the factory. Adherence to this presupposes that the customer has fulfilled his contractual obligations, in particular the agreed terms of payment, and that all documents to be supplied by the customer have been received in good time. Unforeseen obstacles - regardless of whether they occur in our plant itself or at our subcontractors - such as: cases of force majeure, political influences, strikes, rejects or other delays in the completion of essential delivery parts through no fault of our own, general difficulties in procuring materials for the industry, others Malfunctions, delays in transport release us from adhering to the agreed delivery times. In such cases, the delivery time will be extended appropriately. Even then, the aforementioned circumstances are not acceptable to the supplier

# General terms and conditions

responsible if they occur during an already existing delay in delivery. The customer is not entitled to compensation if the delivery time is exceeded.

## 5. Shipping:

Shipping is at the risk of the customer. Goods lost or damaged during transport will only be replaced by us on the basis of a new order against calculation of the currently valid prices. We only take out insurance against transport damage if expressly requested by the customer for his account and to the best of our judgement. Deviations from the delivery note or the invoice must be reported in writing immediately after receipt of the goods.

## 6. Liability for defects:

Defective tools will be replaced free of charge within the statutory limitation period. No liability is assumed for tools that are subject to premature consumption due to their material properties or the way they are used, nor for damage resulting from natural wear and tear, incorrect or negligent treatment, excessive stress, unsuitable operating resources, chemical, electrochemical or electrical influences, Weather or other natural influences. All orders, especially orders with abnormal dimensions and special orders, will be confirmed by us. The customer is obliged to this order confirmation to check that they are correct and to correct any discrepancies immediately. The text of our order confirmation is decisive for the execution of the order.

## 7. Special tools:

When ordering non-catalogue items, the delivery quantity may be about 10% more or less than the order quantity. With order quantities up to 5 pieces by 1 piece, with order quantities from 6 to 20 pieces by 2 pieces. The delivery quantity is calculated.

## 8. Miscellaneous:

Conditions of purchase of the customer that contradict these conditions are non-binding for us, even if they form the basis of the order and we have not expressly objected to their content. The sole place of jurisdiction for all disputes arising directly or indirectly from the contractual relationship is D-88471 Laupheim. The liability of the above terms of delivery is not affected by the ineffectiveness of individual points.

## 9. Raw material surcharges:

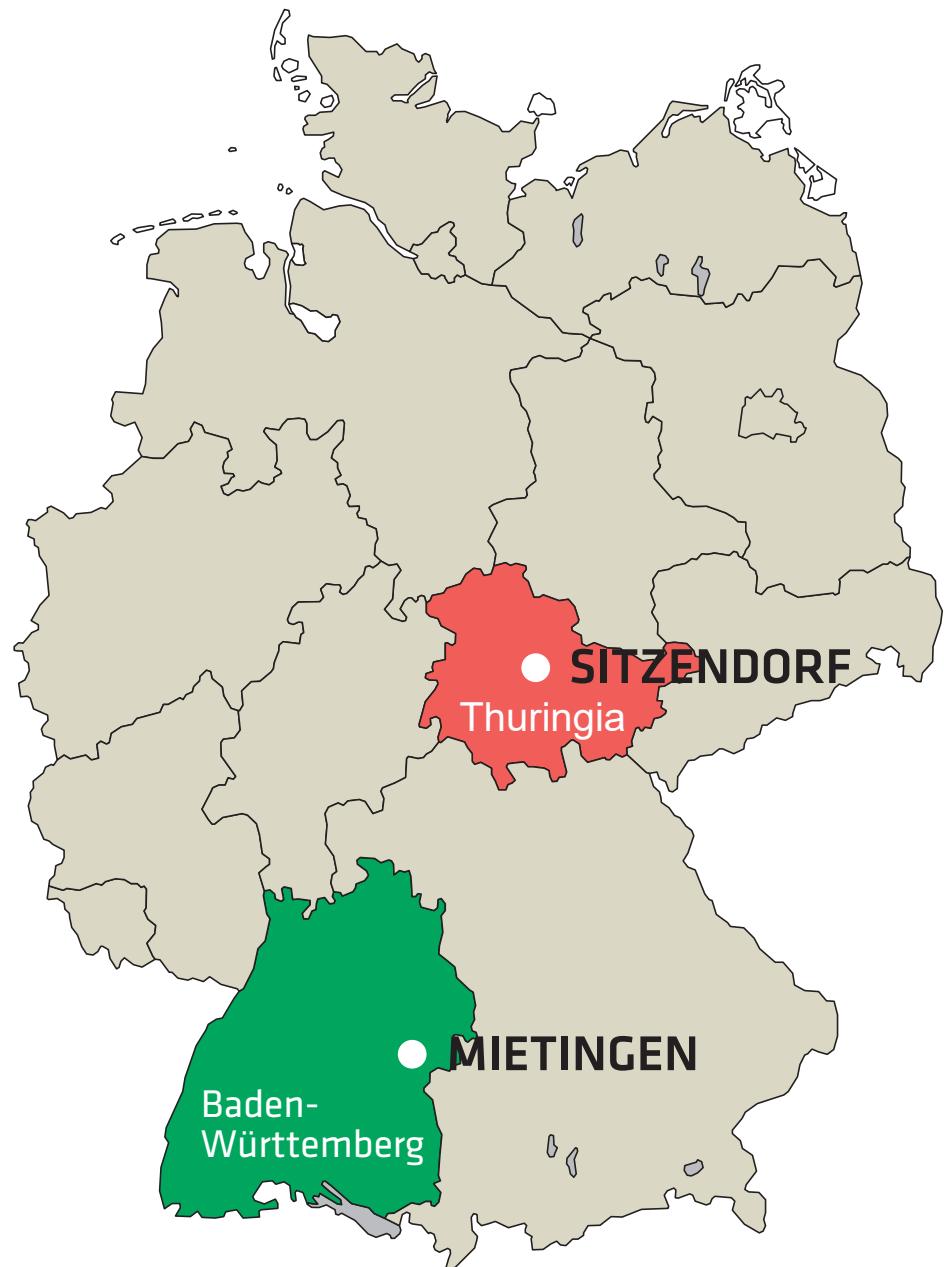

We reserve the right to charge variable raw material surcharges separately. For HSS and HSS/E: alloy surcharge (LZ) and for HM, solid carbide, cermet, PCD/PKB: raw material price surcharge (RTZ)

## 10. Privacy/Other:

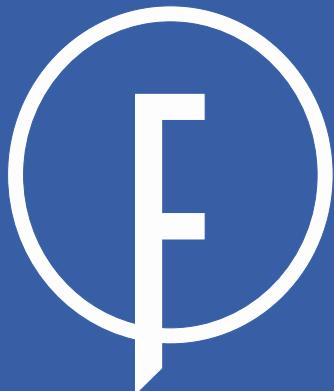

Our data protection declaration, consent and additional information can be found on our website at <https://fromm-praezision.de/datenschutz>

## Our plants: (GERMANY)

You can find our regional and international representatives on our website:  
<https://fromm-praezision.de/en/Company/Partners/>

# About us:

For almost 90 years **Fromm Präzision** is the innovative partner for industry and commerce all over the world. In 2 different branches situated in Thüringen and Baden-Württemberg, 45 employees manufacture precision tools for the metal industry.

Long and deep experiences, permanent cooperation with all our customers, the know-how, the responsibility of our specialists as well as our up-to-date working machines and the own examination laboratory are the main points giving us the reputation of a reliable partner in cooperation.

First class quality can be furnished in HSS, HSS/E, carbide-tipped, solid carbide, CERMET, PCD and PCB.

## World wide represented in:

Europe

Asia

America

## Range of tools:

### Reamers

HSS-HSS/E hand- and machine reamers

Carbide-tipped hand- and machine reamers

Solid carbide hand- and machine reamers

Solid carbide machine reamers with NC-shank and coolant supply on the flutes or through the centre for blind- or through hole

CERMET-machine reamers

### PCD+PCB tools

Polycrystalline diamond tools are mainly manufacture according to customer's requirements. If required we will supply a drawing to the offer

### Core drills+Countersinks

HSS core drills

Carbide-tipped core drills

HSS, HSS/E + Carbide-tipped countersinks

HSS + HSS/E counter bores

HSS/E pointed countersinks and deburring tools

### Special tools

Special tools we manufacturers for all well known automobile manufactures and their suppliers. But also for the aircraft industry and print-machine manufacturers we are the first to address. (Our department for tool construction will supply the required drawing to the offer)

Our stock system guaranties best availability and good readiness in supplying all our goods. Our stock tolerance for reamers is H7. But because of our well appointed stock of "raw"-tools we have the ability to act in a very short time also for other tolerances or diameters which are not listed in our catalogue.

Please find a selection of our range of tools in our actual catalogue.

Reg.-Nr.: Q1 0297028

## HSS + HSS/E reamer

- ⇒ in full Ø H7, different intermediate dimensions and special tolerances or in steps of 1/100 mm (centesimal)
- ⇒ with straight- or MT-shank, or as shell reamer + holder
- ⇒ cylindrical or different taper reamer
- ⇒ adjustable
- ⇒ NC-execution for direct clamping in hydraulic high-precision and shrink chucks
- ⇒ extra long version
- ⇒ coated e.g. TiN, TiCN, TiALN
- ⇒ standard reamer sets in boxes

## Solid carbide + carbide-tipped/brazed reamer

- ⇒ in full Ø H7, different intermediate dimensions and special tolerances or in steps of 1/100 mm (centesimal)
- ⇒ with straight- or MT-shank, or as shell reamer + holder
- ⇒ cylindrical or different taper reamer
- ⇒ adjustable
- ⇒ NC-execution for direct clamping in hydraulic high-precision and shrink chucks
- ⇒ extra long version
- ⇒ with internal coolant
- ⇒ coated e.g. TiN, TiCN, TiALN
- ⇒ standard reamer sets in boxes

## Coredrill + countersink

- ⇒ with straight- or MT-shank
- ⇒ 3-fluted or multifluted version
- ⇒ coated e.g. TiN, TiCN, TiALN
- ⇒ in standard sets

## Special (reamer) application

- ⇒ according customers drawing or processing case
- ⇒ coated e.g. TiN, TiCN, TiALN
- ⇒ creation of release drawing and cutting value recommendations
- ⇒ PCD- und PCB-reamer
- ⇒ Cermet and Cermet-tipped/brazed

xx.xx = nom.-Ø

# Top-Speed-reamer

## Catalog-No. TS3020

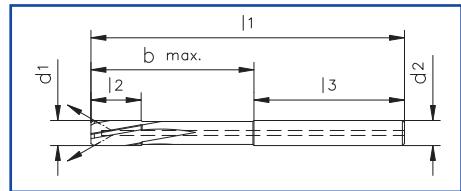

**Solid carbide - K10F**

righthand cutting

straight shank with tol. h6 for NC-machine  
spiral fluted; EU-spacing

**with internal coolant supply (I.C.)**

- Coolant outlet at blade level (radial)

**recommended to work steel, cast, alu, Cu/Zn/Mg-alloy, bronze**

spiral

## Order details:

TS7525IKS-xx.xx-ZY Coolant blade

TS7525IKC-xx.xx-ZY Coolant flute

xx.xx = nom.-Ø

# Top-Speed-reamer

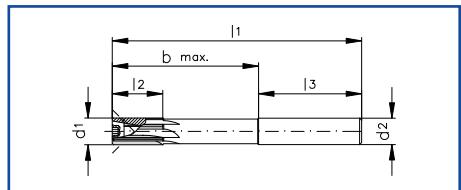

Catalog-No. TS7565

**CERMET-tipped (brazed)**

short version

**expandable**

straight fluted

**with internal coolant supply (I.C.)**

- Coolant outlet at blade level (radial)
- Coolant outlet from the center(axial)

**Can be stretched by approx. 0.02 mm using the front screw**

straight

# 1. Technical information about reamers

Extract from DIN 1420

## Fundamental principles for fixing tolerance limits for the manufacture of reamers

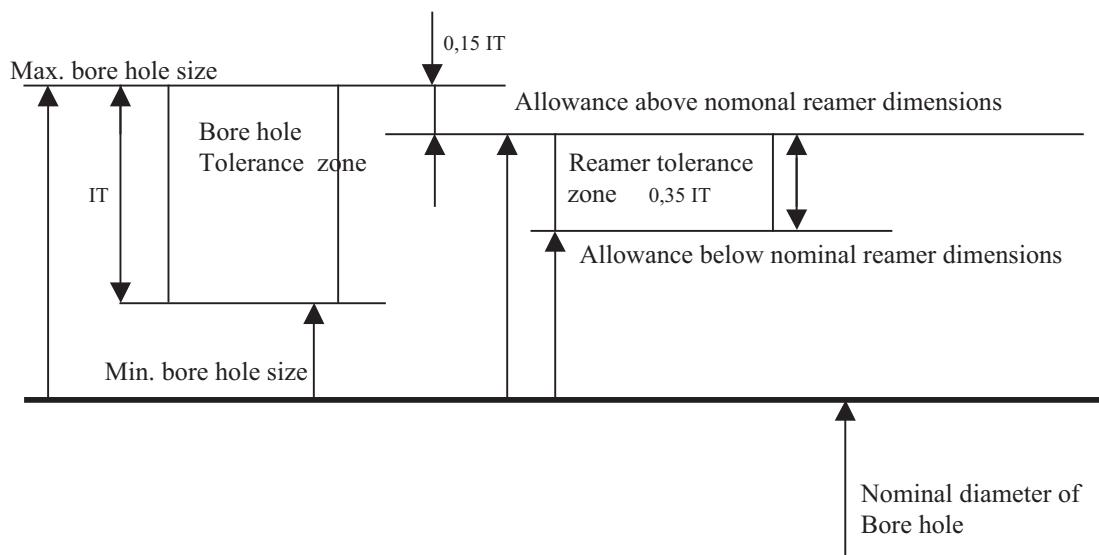

The manufacturing tolerance limits mentioned in this norm are based on the tolerance zones of the bore holes to be reamed (nominal tolerance zone). They ensure that the reamed bore hole lies within the given tolerance zone and, at the same time, that the reamer is used economically. Apart from the manufacturing tolerance, the size of the bore hole reamed is also influenced by other factors: e.g. effective cutting angle, lead angle, how the work piece has been clamped, the seat of the work piece, condition of the machine tool, material, cooling lubricant, etc.

### Fixing minimum and maximum reamer dimensions

The maximum permitted diameter  $d_{max}$  of a reamer lies at 15% of the corresponding bore hole tolerance below the maximum permitted bore hole size (see diagram). The minimum permitted diameter  $d_{min}$  of the reamer lies at 35% of the corresponding bore hole tolerance below the maximum permitted diameter of the reamer  $d_{max}$ . The reamer itself is inscribed with the nominal diameter and tolerance zone of the bore hole.

### Fixing minimum and maximum reamer dimensions

In special cases where reamers are ordered which have dimensions deviating from the minimum or maximum norm, the allowance above/ below the nominal size must be given in  $\mu\text{m}$  where the specification of the ISO abbreviation would normally be written. For example, with a reamer having a nominal diameter of 15mm, an upper allowance of  $+30\mu\text{m}$  and a lower allowance of  $+26\mu\text{m}$ , the inscription reads 15p30p26. In the case of minus tolerance zones, the letter 'm' then replaces the letter 'p'.

## List of tolerances For 1/100-machine reamers according DIN 212

# Definition of measurement

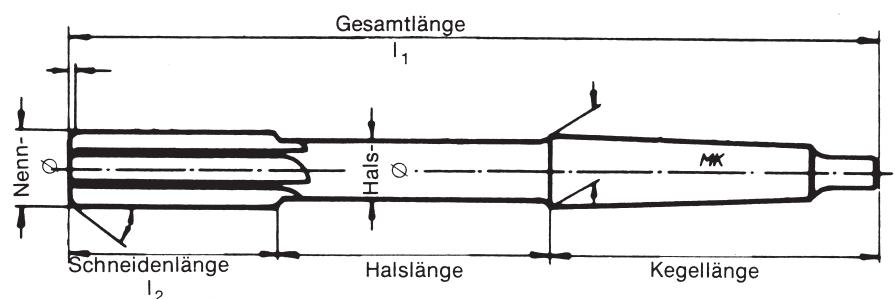

**Handreibahle mit Zylinderschaft und Vierkant, rechtsschneidend, geradegenutet**

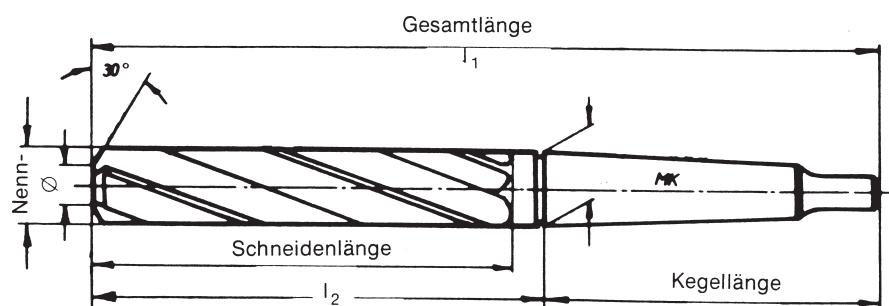

**Handreibahle nachstellbar – mit Zylinderschaft und Vierkant, rechtsschneidend, spiralgenutet**

**Maschinenreibahle mit Morsekegel, rechtsschneidend, geradegenutet**

**Spiralsenker (Aufbohrer) rechtsspiral, rechtsschneidend**

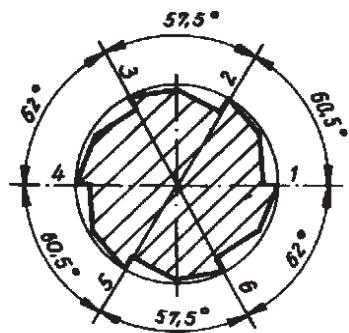

# Achievable bore hole quality

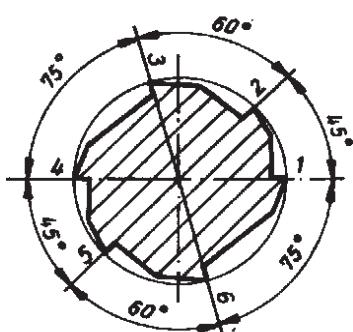

F

A decisive factor in obtaining bore roundness is reamer construction (unequal spacing, extremely unequal spacing or optimally unequal spacing) and the operating conditions (see also: Fault Analysis of Reaming).

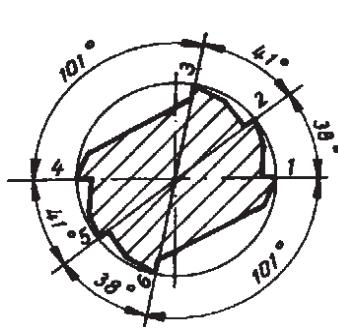

normal unequal spacing

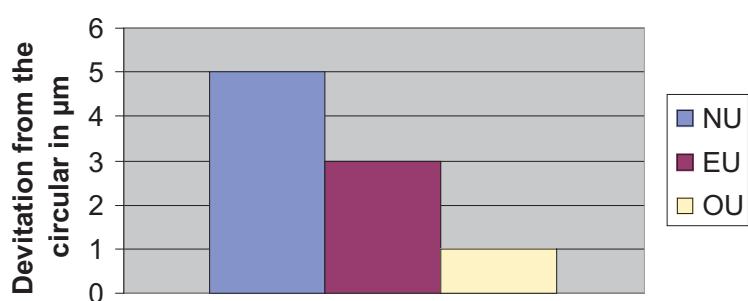

extremely unequal spacing

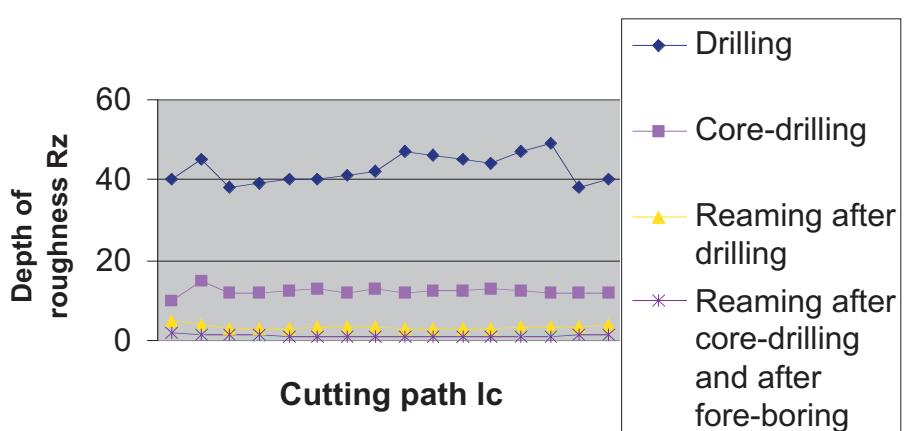

optimally unequal spacing

Influence of cutting pitch on the deviation of the bore hole from the circular

Influence of pre-work on surface roughness

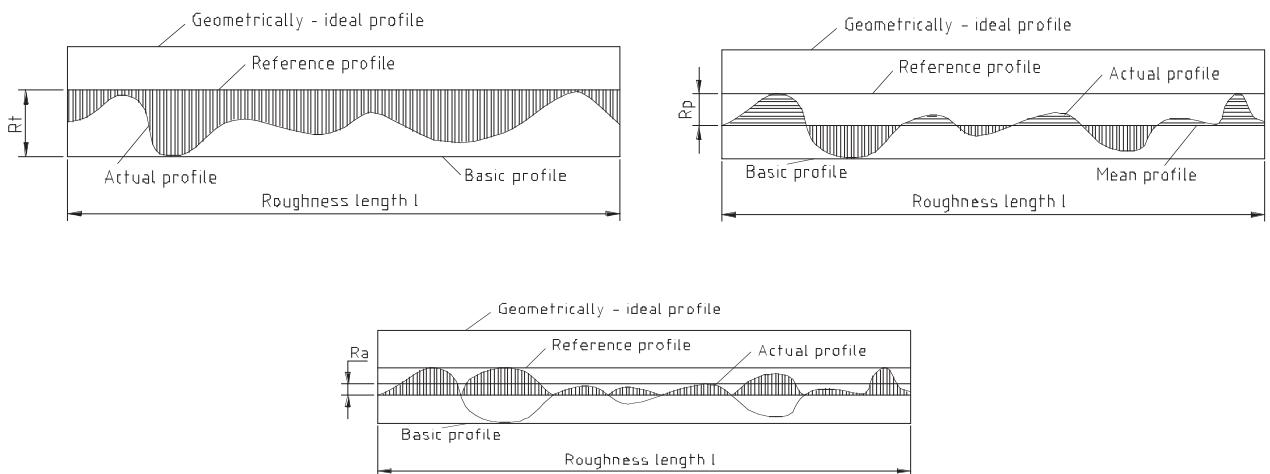

# Definition of measuring roughness

The **depth of roughness  $R_t$**  is the maximum difference in measurement between the reference profile and basic profile. It is the most widely used measurement for determining surface roughness.

The **smoothing depth  $R_p$**  is the distance between the mean profile and the reference profile. Of all measurements of roughness, the smoothing depth gives the best statement concerning the functional pattern of a surface, especially with regard to sliding and pressed surfaces.

The **mean roughness value  $R_a$**  is the distance between one flattening line and the mean profile.

The **calculated mean depth of roughness  $R_z$**  is the arithmetical mean value calculated from five single peak-to-valley heights measured in five adjacent sections of the same length in Reference Section I.

## Measurement of roughness

Average roughness $R_z \mu\text{m}$	Mean roughness value $R_a \mu\text{m}$	Depth of roughness $R_t \mu\text{m}$	Smoothing depth $R_p \mu\text{m}$

# Pro and Contra about Cermet

## ADVANTAGES

- mainly for machining steel
- mainly for finishing, precision and finish-machining (reaming, finish-turning, finish-cutting)
- very hard: less flank wear
- resistant to chemicals (minimal chemical reaction during machining operation):
  - less crater wear
  - fewer built-up edges
- no cooling agent required: lower costs, no work piece cleaning necessary
- due to resistance to chemicals and temperature = less edge wear. Results in improved surface quality and high measuring accuracy
- high cutting velocity: up to 500 m/min. on steel (lower work piece costs)

## DISADVANTAGES

- not suitable for roughing, less suitable for machining cast iron
- considerably lower endurance than (coated) hard metal: not suitable if “labile chucking fixture” is present
- not suitable for interrupted cutting, cannot endure sudden loads on the edges
- unsuitable for compound materials, i.e. changing materials machined with one tool
- unsuitable where high rotational speeds create vibrations
- Cermet = conducts heat slower than hard metal. Therefore more sensitive to fluctuations in temperature (cooling)
- risk of thermal shock fissures
- a special technique is required to grind these tools (including centerless grinding).

# The advantages of coatings on tools

HSS-tools are usually coated with TiN. In the case of HM-tools, other varieties of coatings are possible as a result of PVD and CVD processes. Several coatings and their respective advantages are listed below.

## **TiN-coating:**

Increases a tool's endurance by approx. 200%; reduced tendency to form built-up edges; suitable for precision work. May be applied to HSS and HM-tools. A coating of silver-TiN has shown to give more protection against wear and to reduce the formation of built-up edges than coatings with gold-TiN.

## **TiCN-coating:**

Higher resistance to wear than TiN, therefore longer service life. Especially suitable for use on high-alloy steels.

## **TiAlN-coating:**

Higher resistance to wear than TiN; therefore longer service life. Especially suitable for use on hard steels and cast iron.

## **Carboride-coating:**

This coating has good gliding properties and therefore forms fewer built-up edges. Especially suitable for HM-reamers for use on stainless steel and high-temperature steel.

## **Diamond-coating:**

HM-tools attain a high resistance to wear. Only suitable for Fe- and TiN-free materials. Also suitable for the high-speed machining of Al, Cu and plastics; Alternative to tools tipped with PCD-plates.

Advantage: considerably lower price

Disadvantage: slightly reduced service life

Further information can be found in the table on coatings on Page 139.

 Recommendations for drills and core drills

## Cooling and cutting oils for reaming

Material to machine	Reaming
Tool steels	Diluted soluble oil
Alloyed steels	Diluted soluble oil, cutting oil
Stainless and heat resistant steels	Bore oil, cutting oil
Cast iron steels	Diluted soluble oil
Grey cast iron	Dry
Chilled cast iron	Diluted soluble oil
Malleable cast iron	Dry, diluted soluble oil
Brass	Dry, diluted soluble oil
Bronze	Dry, diluted soluble oil
Copper	Diluted soluble oil
Red cast iron	Dry, Diluted soluble oil
Aluminium	Diluted soluble oil, petroleum
Plastic	Dry

# Fault analysis of reaming

Influencing factors and sources of error	Relevant measures to remedy the situation
<b>1. Diameter of the reamed bore hole too large (excessive width = rejects!)</b>	
1.1 Material "widens" as result of lower density or non-rigid structure	1.1.1 Reduce reamer diameter 1.1.2 Avoid widening working (see below)
1.2 Concentricity of tool or machine spindle inadequate	1.2.1 Track or clamp reamers centrally; Use floating tool holder
1.3 Chamfer too short or highly uneven	1.3.1 Extend chamfer or reduce effective cutting angle 1.3.2 Grind chamfer exactly cylindrically
1.4 Chip removal too high	1.4.1 Reduce machining allowance
1.5 Lubricating agent used contains too little grease dry-reaming performed	1.5.1 Use lubricants
1.6 Cutting velocity too high	1.6.1 Reduce cutting velocity
1.7 Excessive feed	1.7.1 Decrease feed
<b>2. Diameter of the reamed bore hole too small</b>	
2.1 Highly dense material or rigid structure	2.1.1 Increase reamer diameter 2.1.2 Avoid constricting working conditions as follows:
2.2 Material causing increased wear	2.2.1 Use hard metal reamers 2.2.2 Lubricate and cool carefully
2.3 Tool blunt	2.3.1 Check cylindrical grinding process 2.3.2 Remove cutting waste caused by abrasion of the face
2.4 Chamfer too long	
2.5 Insufficient chip removal	
2.6 Lubricant too effective	
2.7 Cutting velocity too low	
2.8 Inadequate feed	
<b>3. Reduced width at the hole exit</b>	
3.1 Feed too high where reamer emerges	3.1.1 Reduce feed just before pass 3.1.2 Use even, controlled feed
<b>4. Cross-section of the bore hole uneven, not centered</b>	
4.1 Concentricity of tool inadequate	4.1.1 Chuck reamers centrally 4.1.2 Guide (use reamers with pilot guide) 4.1.3 Use floating tool holder 4.1.4 Ensure cylindrical running of work spindle
4.2 Lead angle too wide	4.2.1 Reduce lead angle on repointing
4.3 Chip removal too high	4.3.1 Reduce machining allowance
4.4 Chamfer irregular (untrue)	4.4.1 Always grind chamfer sharp and cylindrically 4.5.1 Accurate guidance (use reamers with pilot guide)
4.5 Insufficient guidance	
<b>5. Not precisely cylindrical (conical widening)</b>	
5.1 Tool-chucking not truly aligned	5.1.1 Align (spindle and tool) axis with machining with axis of spindle and work piece (bore hole) axis 5.1.2 Use guide with lining
5.2 Concentricity of spindle and tool inadequate	5.2.1 Align axis 5.3.1 Use front reamers (90° chamfer)
5.3 Chamfer inappropriate	
5.4 Tool-holding too strong	5.4.1 Use floating tool holder

# Fault analysis of reaming

Continued

Influencing factors and sources of error	Relevant measures to remedy the situation
<b>6. ## 2. Technical information about countersinks and core drills

Countersink tools are supplementary to drilling tools. The area of application of counterbores ranges from de-burring bore holes to carrying out both the superficial and deep countersinking of bore holes. Depending on the machining task and the set-up, a clear differentiation is made between spot facers, counterbores, countersinks, progressive sinks and de-burrers.

The cutting section of a core drill is usually longer than that of a sink. Core drills are used for enlarging existing bore holes with the objective of improving the quality of the bore hole (surface, roundness and cylindricity). To achieve this objective, core drills are designed with three cutting edges having wide chip grooves and a strong core.

Generally-speaking, only part of the bore hole is made using a core drill. The cutting geometry of de-burring tools is designed in such a way that only the burr is removed and a small land is produced around the circumference of the bore hole. Deep countersinks should not be performed using a de-burrer. De-burrers would wear prematurely as a result.

Countersinks and core drills have a cutting geometry specially designed for this purpose. They have a wider axial and radial lead angle. The mechanical workload of a countersink is much higher than that of a de-burrer. Compared with countersinks, core drills usually have a considerably more stable shaft and are thus more capable of higher chipping performances.

The tools made by **FROMM-Präzision** are optimally designed for the intended use, both as far as their cutting geometry and their robustness are concerned. **FROMM-Präzision** countersinks and core drills are also characterized by their high degree of concentricity, minimum cutting offset and large chip grooves.

If you have any questions concerning tool geometry, don't hesitate to contact our technicians or send us the enclosed questionnaire (see page 143) and a work piece sketch.

### Selecting cutting materials for countersinks and core drills

At **FROMM-Präzision**, countersinks and core drills are fabricated using HSS or HM with and without coatings. The construction is less dependent upon the cutting parameters and more associated with increasing the service life of the tool.

For this reason, two types of coating are available for selection:

**TiN-coating:** Universal coating, considerable increase in service life approx. 200-300%), reduction of built-up edges in machining

**TiAIN-coating:** High-performance coating, considerably increased service life even compared with the TiN-coating, reduction of built-up edges

# Machining guidelines for HSS countersinks and HSS core drills

Material group	Nr	$V_C$ (m/min) $f_R$ (mm/U)	Countersinks and core drills

# Recommendations for cooling lubricants for countersinks and core drills

In principle, countersinks can be used dry. However, wet machining does result in a considerably extended service life. In the case of deeper countersinking and core drilling, a lubricant should always be used. This does not only increase the service life of the tools but also improves the quality of the bore hole surface. In addition, the transport of chips away from the bore hole is also improved. Emulsions with concentrations of 5-10% or cutting oils may be used as lubricants.

## Countersink and core drill fault analysis

Fault	Possible causes /remedies
Flank wear too high	Check stability of machine, work piece and chucking Increase concentration of cooling agent Reduce cutting velocity
Wear of land	Check concentricity; concentricity < 0.04mm?“ Increase concentration of cooling agent Reduce cutting velocity
Cutting edges defect	Check concentricity Check stability of machine and chucking, vibrations? Reduce feed Increase pressure of cooling agent Resharpen tool punctually
Built-up edges	Increase concentration of cooling agent Increase cutting velocity Resharpen
Tool breakage	Check concentricity Reduce feed, tool is overloaded Check stability of machine and chucking
Tool chatters, jams	Check concentricity Check stability of machine and chucking, vibrations?

# Germany

We manufacture exclusively in Germany with qualified and experienced employees and have the most modern manufacturing machines with high production capacity. But still flexible for small series and also for special productions. Our own salt bath hardening with material testing laboratory stand for highest consistent quality.
